

## QUANTITATIVE VOLCANIC ASH (QVA)

### Quantitative Volcanic Ash (QVA) Concentration Information for a first familiarization

#### Table of contents

1. USING QVA INFORMATION .....	1
2. ACCESS TO QVA DATA ON VAAC TOULOUSE WEBSITE <a href="http://vaac.meteo.fr/">HTTP://VAAC.METEO.FR/</a> .....	6
3. ACCESS VIA API METGATE_MF .....	8

#### 1. Using QVA information

Available flyer on ICAO portal contains details :

ICAO-Meteorology Panel: [ICAO portal](#) , Quantitative Volcanic Ash (QVA) Concentration Information, Flyer First edition – 13 September 2022 (corrected 21 June 2024)

Next few pages provide some useful explanation for a first familiarization using QVA.

QVA information provides users with a high-resolution four-dimensional representation of a volcanic ash cloud, providing a more realistic depiction of the ash cloud:

a horizontal resolution of 0.25 degrees latitude and longitude.

a vertical resolution in 5,000-foot /50 flight levels (FL) from mean sea level to FL 600

Mean sea level to FL 50	FL 150 to FL 200	FL300 to FL350	FL450 to FL500
FL50 to FL 100	FL200 to FL250	FL350 to FL400	FL500 to FL550
FL100 to FL150	FL250 to FL300	FL400 to FL450	FL550 to FL600

In three-hourly valid time increments: 0, 3, 6, 9, 12, 15, 18, 21 and 24 hours. QVA information will be updated as necessary but at least every six hours until the volcanic ash cloud is no longer considered a hazard. The 3-hourly time steps of QVA information provides users with more accurate forecast positions of the ash cloud, compared to the 6-hourly time steps of the VAA/VAG.

The VAAC Toulouse QVA ensemble set consists of 100 forecast predictions (+ the deterministic run). In addition to the deterministic model run, the ensemble model runs are launched with the following source term parameters modified: ash ejection height, emission profile, quantity of ash particles, size of ash particles.

Note that it is possible to have no ash exceeding a given threshold in the deterministic run and have relative frequencies exceeding that given threshold in all 100 ensemble forecast (some of the 100 forecasts predict ash cloud). This difference is representative of the uncertainty involved in describing the eruption and predicting the ash cloud.

Probabilistic QVA include the uncertainty of detection and forecast ash cloud. Currently, it isn't the case in current concentration charts; forecasters use their experiences to take in account this uncertainty providing VAA/VAG.

Deterministic and ensemble QVA data will be provided in gridded format NetCDF. In addition, IWXXM format deterministic objects representing ash concentration in the entire atmosphere from Mean Sea Level to FL600, where concentration thresholds are exceeded.

QVA information will likely have its greatest utility with ash cloud events that have a widely dispersed ash cloud with mostly lower levels of ash concentration. Operators with approval and procedures/practices, e.g., maintenance for planned flight into select thresholds of ash concentration, will be able to use QVA information to fly more efficient routes in accordance with their safety management program.

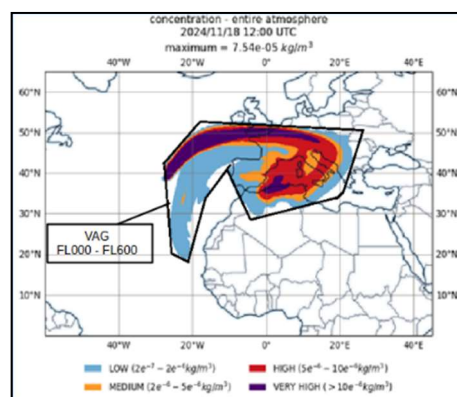

Probabilistic QVA information is intended for use in operator's flight planning and decision support systems. Operators will use probabilistic QVA information in conjunction with their safety management program to optimise airspace and plan more efficient routes during significant volcanic ash cloud events.

**Visualized examples of QVA grid point deterministic information, IWXXM objects with volcanic ash advisory in graphic form (VAG); Comparison to actual VAG**

Provided by VAAC Toulouse using MOCAGE model for the exercise VOLCAZ024 of 07 May 2024

**Figure 1.** *Current format VAG*

**Figure 2.** *IWXXM objects showing all QVA thresholds with VAG overlaid*

IWXXM objects represent ash concentration in **entire atmosphere** from Mean Sea Level to FL600, where concentration thresholds are exceeded.

*Colour Legend:*

Descriptor	Concentration thresholds and ranges	Colour
Very high	$\geq 10 \text{ mg/m}^3$	Purple
High	$\geq 5$ and $< 10 \text{ mg/m}^3$	Red
Medium	$\geq 2$ and $< 5 \text{ mg/m}^3$	Orange
Low	$\geq 0.2$ and $< 2 \text{ mg/m}^3$	Blue
Very low	$< 0.2 \text{ mg/m}^3$	White

*Note that colours were randomly assigned and do not infer any visualization guidelines.*

**Figure 3 (left).** IWXXM objects showing all QVA thresholds depicted in the horizontal from a fictitious volcano located at A. The vertical depiction along line B-C is shown in **Figure 4 (right)**.

**Individual IWXXM objects** depict the individual IWXXM objects from Figure 1, respectively each threshold

**Figure 5.**

**Figure 6.**

**Figure 7.**

**Figure 8.**

**Figure 5** is IWXXM object  $\geq 0.2\text{mg/m}^3$  (the "hole" is ash  $<0.2\text{mg/m}^3$ ).

**Figure 6** is IWXXM object  $\geq 2\text{mg/m}^3$ .

**Figure 7** is IWXXM object  $\geq 5\text{mg/m}^3$ .

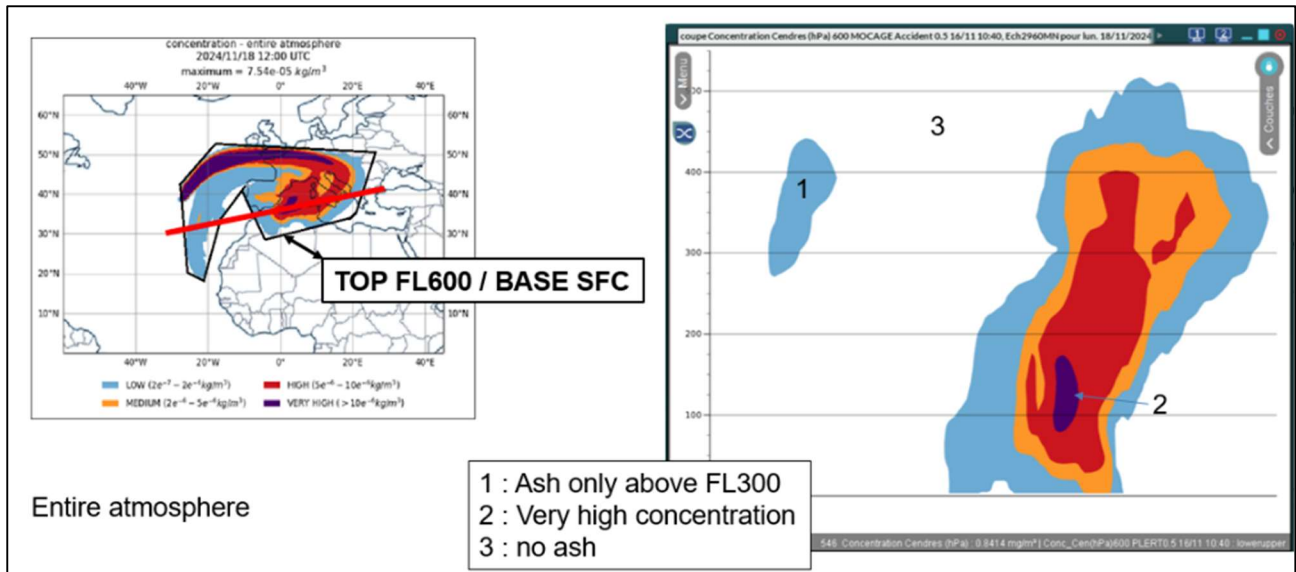

**Figure 8** is IWXXM object  $\geq 10\text{mg/m}^3$ .

**Visual illustration of QVA information IWXXM objects and volcanic ash advisory in graphic form (VAG)**

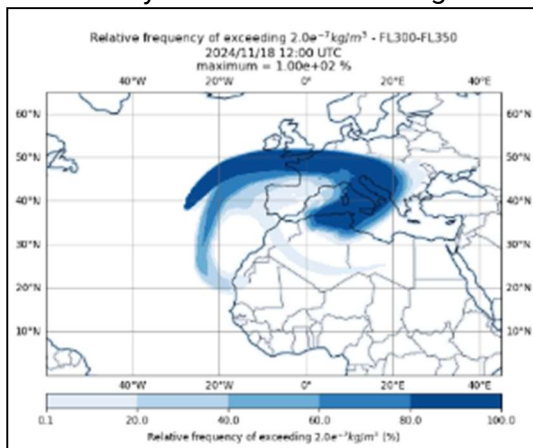

**Figure 9.** Same as Figure 3 but overlaid with the VAG (mauve polygon).

Example of deterministic QVA using MOCAGE model and vertical cross section provided during VOLCEX24

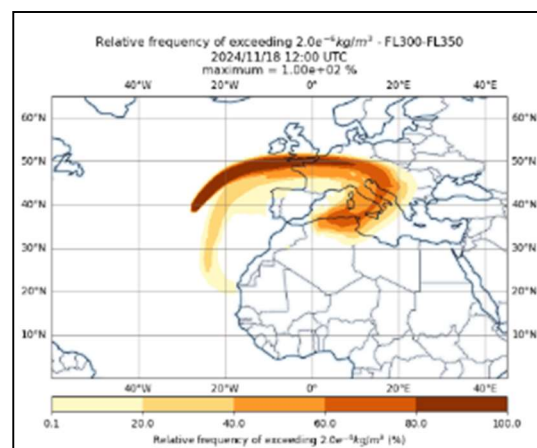

## Example of gridded probabilistic data

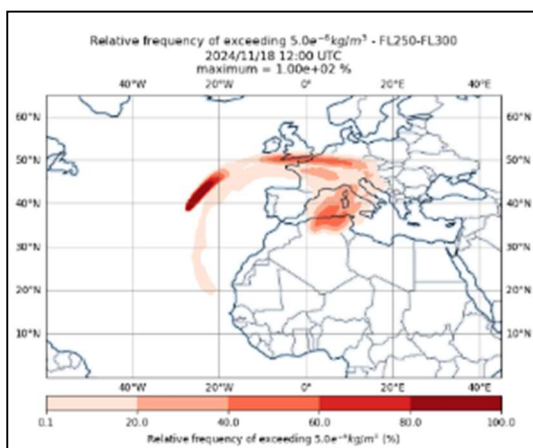

Provided by VAAC Toulouse using MOCAGE model for the exercise VOLCEX24

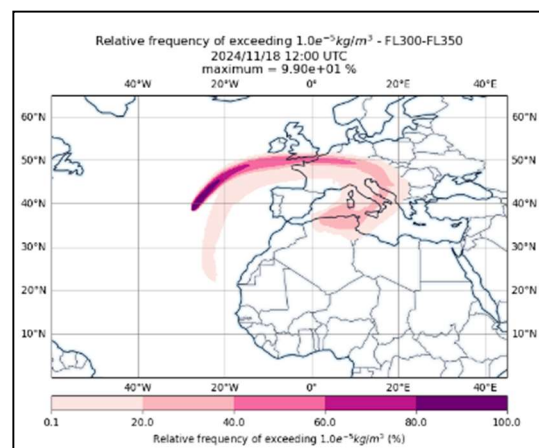

**Figure 10** Relative frequency of concentration exceeding 0.2mg/m<sup>3</sup> FL300-350

**Figure 11** Relative frequency of concentration exceeding 2mg/m<sup>3</sup> FL300-350

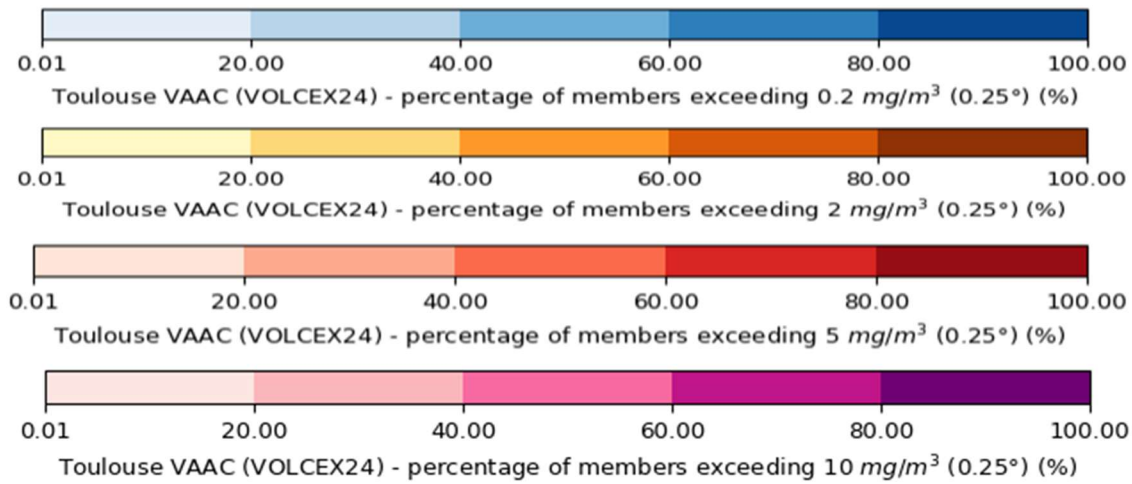

**Figure 12** Relative frequency of concentration exceeding 5mg/m<sup>3</sup> FL300-350

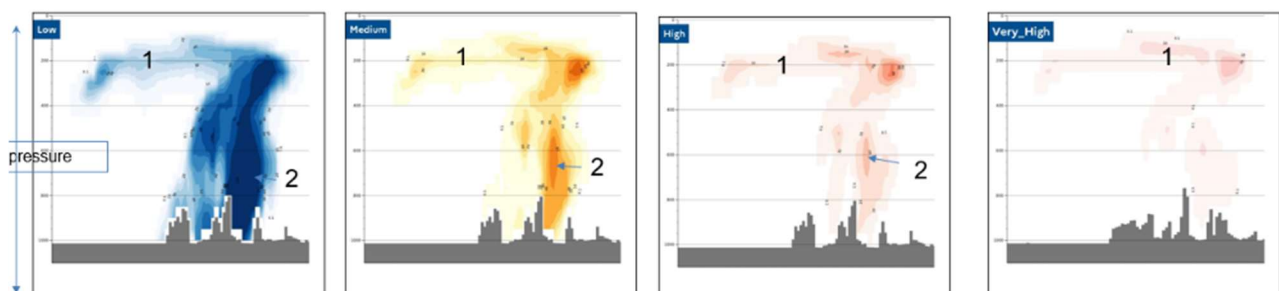

**Figure 13** Relative frequency of exceeding 10mg/m<sup>3</sup> FL300-350

Colour Legend:

Example of probabilistic QVA using MOCAGE model and vertical cross section provided during VOLCEX24

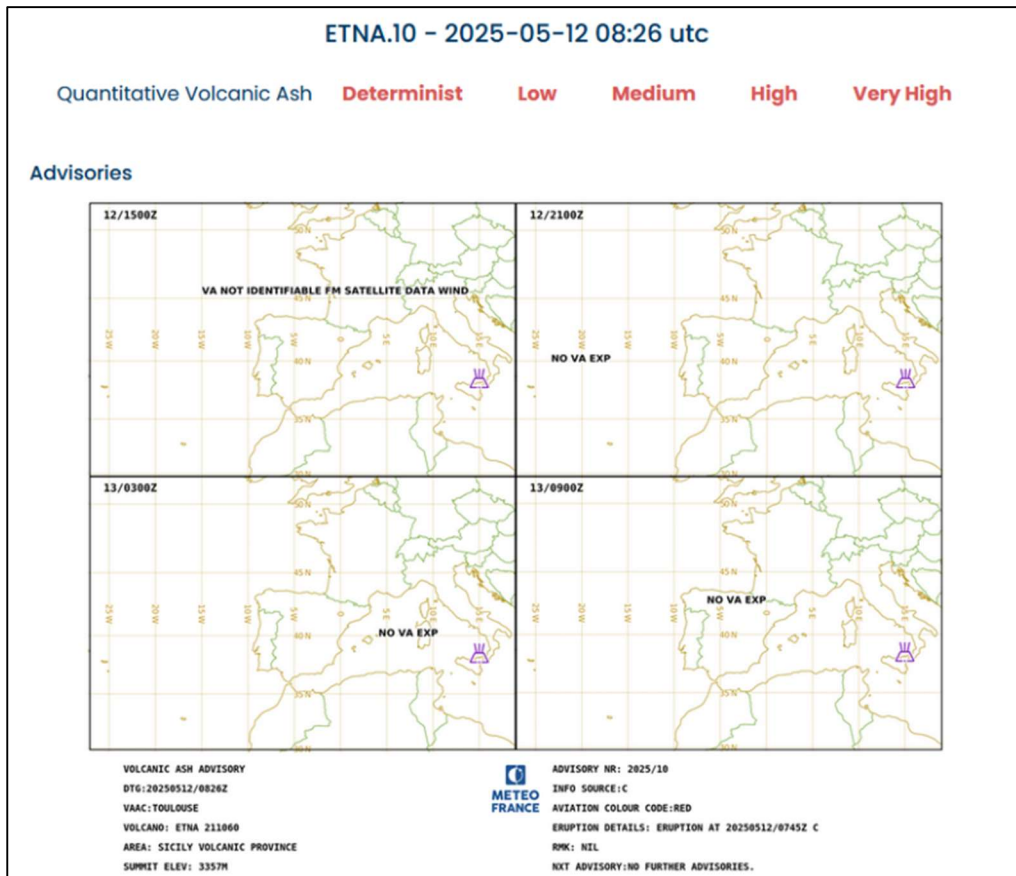

1 : Probability to encounter ash in upper atmosphere

2: High probability to encounter ash but low risk in high concentration

## 2. Access to QVA data on VAAC Toulouse website <http://vaac.meteo.fr/>

Above VAG through red buttons as shown in the example below :

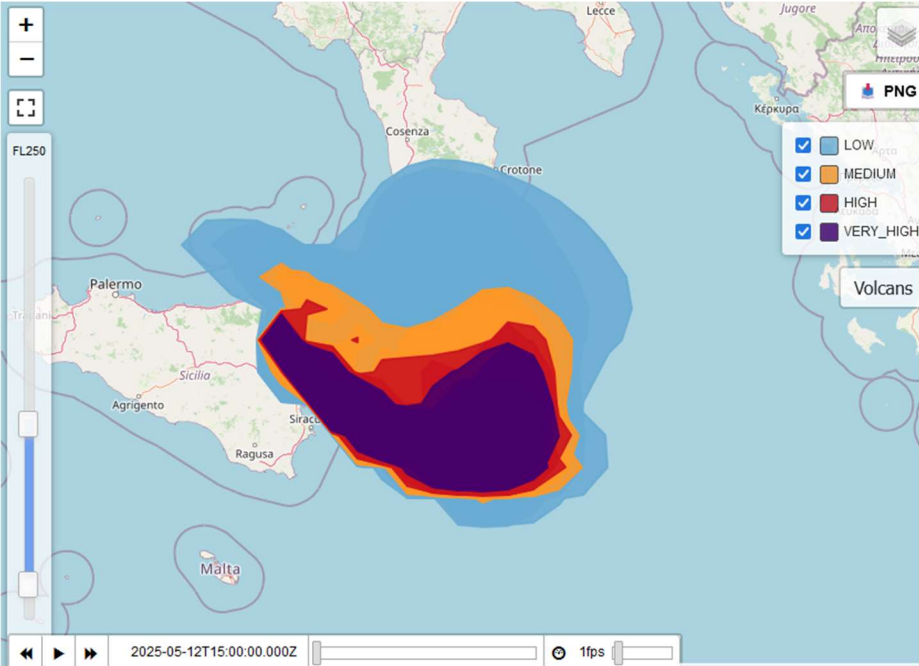

Under VAA through blue buttons as shown in the example below:
